

- much more reactive than  $\text{SeO}_2$
- absence of rearranged products
- positional selectivity similar to  $\text{SeO}_2$

Kresze *J. Org. Chem.* **1983**, 48, 3561

isolable reagent  
lower reactivity  
easier to release primary amine

## Enantioselective Allylic Functionalization

Compatible FG: Ts-Indole, -OTFA, -Hal

Positional selectivity: CH<sub>2</sub> > CH<sub>3</sub> > CH

Positional selectivity: sensitive to electronic effects

- Lewis-acid-assisted Bronsted acidity (LBA)
- Protonation lowers LUMO
- Cis-olefin provides higher enantioselectivity
- Exo transition state

## Sequential Allylic Alkylation

## Enantioselective Allylic Alkylation
